

SCIENCE AUTUMN

The children will learn to label the parts of the body and the functions that some of these perform. We will also learn about the five senses and which body parts are associated with these.

Throughout the course of the year, we will look at weather and seasonal changes. Each term, we will focus on a different season and use the physical environment to explore the different signs of these seasons.

In the second half of the autumn term we will look at materials and make the distinction between an object and what it is made from. We will identify the names of common materials and begin to describe their properties. This will allow us to compare and contrast different materials

We will also develop our investigation skills and will be encouraged to ask questions to further our understanding.
